Hanging out with friends and bored, trying to decide a movie

Say I am hanging out with friends, trying to decide on a movie to watch. We look through Netflix but cannot find a specific movie that piques all of our interests. So, instead we try a new way to find a new movie. Logging in through Twitter, our app scans one of my friend's tweets and assigns a certain sentiment percentage to that person. Multiple other people can also log in and have their twitters scanned, including myself. The average sentiment between all of our Twitter accounts will be taken and the app will suggest movies that all of us could enjoy.
